

LVIV FOOD MARKETPLACE INTELLIGENCE

Market Positioning of a Delivery Restaurant in the Lviv Food Marketplace

A five-layer data project: from a full restaurant market, to a delivery marketplace, to one independent restaurant, to a data-driven competitive benchmark.

Daria Chernykh · Data Analytics Portfolio Project

THE QUESTION

How would a specific, real restaurant's operational data compare if it entered the Lviv food delivery market?

THE APPROACH

A five-layer narrative

The Lviv Restaurant Market

934

restaurants across 6 districts and 46
cuisine types

67%

of restaurants offer delivery in some form

27%

of restaurants are available on Glovo

KEY INSIGHTS

- **Concentrated Cuisines:**
Top 4 categories (*Desserts & Coffee, Pizza, Kebab, Bakery*) account for over **50%** of market supply.
- **Decentralized Demand:**
Outer residential/commercial districts hold **58%** of restaurants; historical center (*Halytskyi*) accounts for only **15%**.
- **Operational Standards:**
Average daily operating window is **~12 hours** (9:00/10:00 - 21:00/22:00); Sunday closures are rare (**7.9%**).
- **Delivery Gap:**
67.1% offer delivery, but only **26.8%** are on Glovo-indicating heavy reliance on direct channels or alternative platforms.
- **Cuisine-Specific Glovo Fit:**
High Glovo penetration in fast-casual (*Pizza 66%, Burgers 56%*); near-zero in experience-driven categories (*Ukrainian 4%, Grill 3%*).
- **Target High-Potential Segments:**
Focus on Asian, Italian, and Ukrainian cuisines - low competition combined with high customer satisfaction.

The Glovo Marketplace

234

restaurants

15,898 individual menu items

60

items - median menu size
per restaurant

215

UAH - median price
263 UAH average price

3,4%

average bestseller share
of menu items

KEY INSIGHTS

- **High Concentration:**
Top 5 cuisines (*Fast Food, International, Pizza, Breakfast, Sushi*) dominate **over 50%** of platform tags.
- **Assortment Core:**
Drinks, Desserts, and Sushi represent **over 33%** of all available items on Glovo.
- **Pricing & Premium Outliers:**
Median prices range from **107 UAH** (*Arabic*) to **315 UAH** (*Sushi*). Premium outliers skew averages, making median the only reliable price benchmark.
- **Targeted Discounting:**
Discounts are shallow (10–20%) and frequent in lower-tier segments, but 3x less frequent in Premium pricing tiers.
- **Focused Merchandising:**
Bestseller tags appear on only **3.4%** of items, concentrated in focused categories like *Business Lunches* (19.6%) and *Georgian* (13.7%).

Our Restaurant - Performance & Operations

2,31M

UAH in revenue across
4,385 transactions (2023–2025)

- 67%

decline in order volume,
733 to 242 orders per year

1639

UAH - average order value

62

unique dishes across
8 menu categories

KEY INSIGHTS

- **High Concentration:**
Extras, Soups, and Main Courses generate **>80%** of total revenue, with a single dish (*Efo Riro*) driving **45%** of soup sales.
- **Volume vs. Value Trade-off:**
Order volume dropped by **67%** (2023–2025), but Average Order Value (AOV) grew from **1,555 UAH to 1,917 UAH**.
- **Channel Shift:**
Third-party platforms (*JustEat*) expanded to **54%** of digital sales, while direct website revenue dropped from **44% to 20%**.
- **Peak Demand Windows:**
Sales spike on **Saturdays** (594k UAH) and daily between **16:00–18:00**; Sundays are currently unserved.
- **Resilient Profitability:**
Despite volume decline, gross margin held at **76.5%** and net margin at **13.6%** (labor, ingredients, and rent account for ~70% of costs).

Our Restaurant vs the Market

OUR RESTAURANT		LVIV MARKET / GLOVO
Menu size	62 items / 8 categories	60 items / 7 categories (median)
Catalog price	491 UAH	215 UAH - +128.5% gap
Operating window	5h/day, closed Sunday	12h/day, 92% open Sunday
Cuisine competitors	0	0 in either dataset - blue ocean
Revenue concentration	45% (1 dish)	3.4% avg. bestseller - 13.2×

What the Data Actually Recommends

1

Premium positioning

+128.5% price gap - consistent with a premium strategy, but customer willingness to pay still needs testing.

2

Underserved cuisine

No direct West African / Nigerian competitors in the benchmark datasets - a genuine blue-ocean cuisine position.

3

Availability gap

A 5-hour window and no Sunday work show that the restaurant could try working longer hours without changing the food or prices.

4

Product dependency

Since one item makes 45% of the category's money, the business depends too much on this single dish staying popular.

How This Was Built

Python

pandas, numpy, matplotlib, seaborn, geopandas, osmnx - cleaning, feature engineering, spatial district mapping

SQL / BigQuery

CTEs, window functions, cross-dataset joins - the benchmark layer comparing all three sources

Tableau

4-page interactive dashboard suite, published on Tableau Public

IMPORTANT NOTE

The benchmark is a hypothetical market-entry exercise, not an analysis of an actual Lviv restaurant.

The restaurant used for comparison operates in a different country, on different delivery platforms, in a cuisine absent from both Lviv datasets.

The project applies real market-positioning methodology to real operational data to ask "how would this restaurant compare if it entered this market?" - metrics without a genuine market equivalent were deliberately excluded rather than forced into a misleading comparison.

DELIVERABLES

Four Interactive Dashboards

01

Lviv Restaurant Market

Districts, cuisines, business models, delivery coverage

02

Glovo Marketplace

Menu categories, pricing, bestsellers, discounts

03

Our Restaurant

Sales trends, menu performance, channels, profitability

04

Competitive Benchmark

Our restaurant vs. market, side by side
